These fusion rings also invite questions in the spirit of [1, Question 1.13].

I.4. Ranks 8 and 9. There are 792 integral 1-Frobenius Drinfeld rings of rank 8 with $\text{FPdim} \leq 25000$, and 1292 such rings of rank 9 with $\text{FPdim} \leq 2000$. Copy-pastable data can be found in the files `1FrobR8d25000.txt` and `1FrobR9d2000.txt`, located in the `Data/General` directory of [8].

I.5. Addressing divisibility. The classification at rank r begins with the list of length r Egyptian fractions representing the possible

$$\sum_V \sum_{i=1}^{n_V^2} \frac{1}{n_V f_V} = 1,$$

where the (f_V) are the formal codegrees of the Drinfeld ring; see [1, §2.2]. Under the Drinfeld assumption, each formal codegree f_V divides f_1 . Moreover, the Drinfeld ring is commutative if and only if $n_V = 1$ for all V . In this case, we can restrict to Egyptian fractions of length r satisfying the divisibility condition $f_V \mid f_1$ for all V .

In the noncommutative setting, it may happen that $n_V f_V$ does not divide f_1 for some V . However, as verified in [1, §III], no such exceptions occur up to rank 8 (but they do appear at rank 9; see [1, §2.2]). Therefore, for ranks $r \leq 8$, it is safe to restrict to Egyptian fractions of length r that satisfy the divisibility condition.

At rank 9, [1, Lemma 9.3] shows that the complexified noncommutative Drinfeld ring must be isomorphic to either $\mathbb{C} \oplus M_2(\mathbb{C})^2$ or $\mathbb{C}^5 \oplus M_2(\mathbb{C})$. The exception corresponds to Egyptian fractions of length 5 or 7 with one or two terms having $n_V = 2$, and at least one violating the divisibility condition $n_V f_V \mid f_1$.

We verified that for $\text{FPdim} \leq 32000$, the values arising from these exceptional cases are already covered by those for the Egyptian fractions of length 9 satisfying the divisibility condition. Details of this computation can be found in the file `InvestNCRank9Except.txt` of the `Data/EgyptianFractionsDiv/Except` folder of [8].

II. MNSD DRINFELD RINGS

As established in [1, §8], the Grothendieck ring of any odd-dimensional integral fusion category over $\mathbb{C}$ is an MNSD integral Drinfeld ring ([1, Definition 8.6]). This section provides a complete classification of such rings up to rank 9.

II.1. Up to rank 5. There are four MNSD integral Drinfeld rings up to rank 5, contained in §I.1, namely the Grothendieck rings of $\text{Rep}(G)$, with $G = C_1, C_3, C_5, C_7 \rtimes C_3$.
